Dear business friends,

You have just got the second issue of our TechNews, in which we would like to convince you about reliability of VELTEKO machines based on statistic dates and would like to inform about our biggest packaging machine HSV 50-1020 and possibility to form standing bags with welded side (our type "F").

Reliability of VELTEKO machines

The costs for service are an important factor for judging quality of a machine and its operation costs. The service costs include spare parts and service trips. In our quality management system in accordance with the ISO 9001:2000 standard we monitor, among others, detailed statistics concerning reliability of our machines. The dates are quarterly evaluated and the corresponding technical and organizational actions are taken. These actions show themselves for example in reducing of quantity of service trips by a continuous increase of quantity of machines in operation as it is shown in the graph.

This clear tendency is in addition to the above mentioned influenced by following other factors:

- New constructional solutions we make based experience with foregoing generation of our machines and based on information and suggestions from our customers
- Our machines are completed with reliable components made by renowned world companies
- Continually and systematically we use corrective and especially preventative actions to avoid problems found on weak points
- On request we deliver our machines with modem that enables connection of controlling system of machine with our servicemen what can lead to solving problem without a service trip
- We offer and make preventative inspections of machines at customer´s plant what help to identify possible defects before coming to disrepair.

After summary of all above written, we see that reliability of VELTEKO machines increases. After commissioning and training of operating staff our machines operate reliably with a minimal need of service. Generally it is necessary to indicate standard machine maintainance (cleaning, lubrication, exchange of expendable supplies) and ordinary adjusting only.

Ing. Tomáš Valla,
service manager

A larger version of HSV 50 A BIG

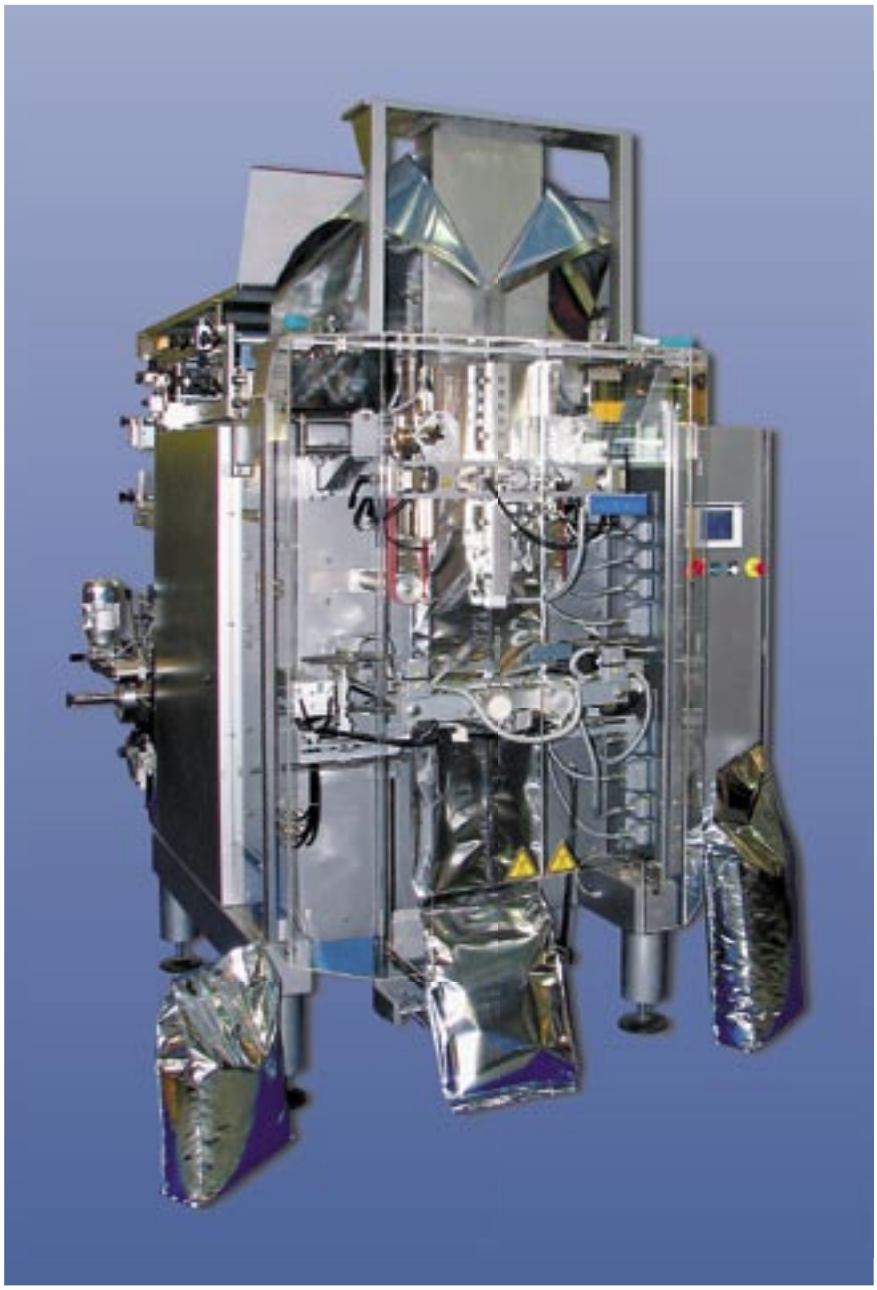
VELTEKO is coming with a larger version of its biggest vertical form, fill and seal machine
HSV 50A BIG. This larger version enables to form bags from the film of width up to 1100mm.
The maximal volume of product in a pouch bag
(VELTEKO´s type A) is 50 litres.

During a few last months VELTEKO has already installed several machines for packing of petfood.
It belongs to machines that are mostly in sale.

In addition to petfood the larger version of HSV 50 A BIG is suitable for such products
as powders, fertilizers, etc. For sure it will find its use in the packing for catering companies.

The larger HSV 50 can be equipped with all dosers and additional devices that are offered by VELTEKO including zipper applicator.

At this years exhibition Salima VELTEKO presented the new possibility of this machine – forming
of standing bags with welded sides
(VELTEKO´s type F).



Applicator of advertising band

Applicator of advertising band is one of the additional equipments, we offer for our VFFS machines. It is used for various promotional activities or in case that it is necessary to tell additional information to customers or if a new language version is needed. The use of advertising band brings substantial financial savings for customers, because it enables to run down the old film and to buy just advertising band what is substantially cheaper than to design and print a new film.
